

Clark Y Airfoil — Build Template

Chord: 150 mm Max thickness: 13.7 mm (9.1%) at 36% chord Source: clarky.txt (Selig UIUC database)

Print at 100% / actual size — no scaling. Verify chord line = 150 mm with a ruler before cutting.

How to build from this template:

1. Cut out the profile or trace the outline onto your rib material.
2. The lower surface curves slightly downward near the leading edge (first ~24mm), then rises back to the chord line.
3. From $x = 27\text{mm}$ onward the lower surface is nearly flat — use a straight edge along the baseline when building.
4. Leading edge is a tight curve — sand or cut carefully around $x = 0$.
